INSTALLATION

The software provided with this card is contained on either one CD or multiple diskettes and must be installed onto your hard disk prior to use. To do this, perform the following steps as appropriate for your software format and operating system. Substitute the appropriate drive letter for your CD-ROM or disk drive where you see D: or A: respectively in the examples below.

CD INSTALLATION

DOS/WIN3.x
1. Place the CD into your CD-ROM drive.
2. Type D: Enter to change the active drive to the CD-ROM drive.
3. Type INSTALL Enter to run the install program.
4. Follow the on-screen prompts to install the software for this card.

WIN95/98/NT
1. Place the CD into your CD-ROM drive.
2. The CD should automatically run the install program after 30 seconds. If the install program does not run, click START | RUN and type D:INSTALL Enter.
3. Follow the on-screen prompts to install the software for this card.
4. Click the “Go to ACCES Web” button to check for software updates.

3.5-INCH DISKETTE INSTALLATION

As with any software package, you should make backup copies for everyday use and store your original master diskettes in a safe location. The easiest way to make a backup copy is to use the DOS DISKCOPY utility.

In a single-drive system, the command is:

```
DISKCOPY A: A: Enter
```

You will need to swap disks as requested by the system.

In a two-disk system, the command is:

```
DISKCOPY A: B: Enter
```
This will copy the contents of the master disk in drive A to the backup disk in drive B.

To copy the files on the master diskette to your hard disk, perform the following steps.
1. Place the master diskette into a floppy drive
2. Change the active drive to the drive that has the diskette installed. For example, if the diskette is in drive A, type \A:.
3. Type INSTALL and follow the on-screen prompts.

DIRECTORIES CREATED ON THE HARD DISK

The installation process will create several directories on your hard disk. If you accept the installation defaults, the following structure will exist.

[CARDNAME] Root or base directory containing the SETUP.EXE setup program used to help you configure jumpers and calibrate the card.

DOS\PSAMPLES: A subdirectory of [CARDNAME] that contains Pascal samples.

DOS\CSAMPLES: A subdirectory of [CARDNAME] that contains “C” samples.

WIN32\language Subdirectories containing samples for Win95/98 and NT.

WinRisc.exe: A Windows dumb-terminal type communication program designed for RS422/485 operation. Used primarily with REMOTE ACCES Data Acquisition Pods and our RS422/485 serial communication product line. Can be used to say hello to an installed modem.

ACCES32: This directory contains the Windows 95/98/NT driver used to provide access to the hardware registers when writing 32-bit Windows software. Several samples are provided in a variety of languages to demonstrate how to use this driver. The DLL provides four functions (InPortB, OutPortB, InPort, and OutPort) to access the hardware.

This directory also contains the device driver for Windows NT, ACCESNT.SYS. This device driver provides register-level hardware access in Windows NT. Two methods of using the driver are available, through ACCES32.DLL (recommended) and through the DeviceIOControl handles provided by ACCESNT.SYS (slightly faster).

SAMPLES: Samples for using ACCES32.DLL are provided in this directory. Using this DLL not only makes the hardware programming easier (MUCH easier), but also one source file can be used for both Windows 95/98 and WindowsNT.
One executable can run under both operating systems and still have full access to the hardware registers. The DLL is used exactly like any other DLL, so it is compatible with any language capable of using 32-bit DLLs. Consult the manuals provided with your language’s compiler for information on using DLLs in your specific environment.

**VBACCES:** This directory contains sixteen-bit DLL drivers for use with VisualBASIC 3.0 and Windows 3.1 only. These drivers provide four functions, similar to the ACCES32.DLL. However, this DLL is only compatible with 16-bit executables. Migration from 16-bit to 32-bit is simplified because of the similarity between VBACCES and ACCES32.

**PCI:** This directory contains PCI-bus specific programs and information. If you are not using an ACCES PCI card, this directory will not be installed.

**SOURCE:** A utility program is provided with source code you can use to determine allocated resources at run-time from your own programs in DOS.

**PCIFind.exe** A utility for DOS and Windows to determine what base address and IRQ are allocated to installed PCI cards. This program runs two versions, depending on the operating system. Windows 95/98/NT displays a GUI interface, and modifies the registry. When run from DOS or Windows3.x, a text interface is used. For information about the format of the registry key, consult the card-specific samples provided with the hardware. In Windows NT, NTioPCI.SYS runs each time the computer is booted, thereby refreshing the registry as PCI hardware is added or removed. In Windows 95/98/NT PCIFind.EXE places itself in the boot-sequence of the OS to refresh the registry on each power-up.

This program also provides some COM configuration when used with PCI COM ports. Specifically, it will configure compatible COM cards for IRQ sharing and multiple port issues.

**WIN32IRQ:** This directory provides a generic interface for IRQ handling in Windows 95/98/NT. Source code is provided for the driver, greatly simplifying the creation of custom drivers for specific needs. Samples are provided to demonstrate the use of the generic driver. Note that the use of IRQs in
near-real-time data acquisition programs requires multi-threaded application programming techniques and must be considered an intermediate to advanced programming topic. Delphi, C++ Builder, and Visual C++ samples are provided.

Findbase.exe DOS utility to determine an available base address for ISA bus, non-Plug-n-Play cards. Run this program once, before the hardware is installed in the computer, to determine an available address to give the card. Once the address has been determined, run the setup program provided with the hardware to see instructions on setting the address switch and various option selections.

Poly.exe A generic utility to convert a table of data into an $n^{th}$ order polynomial. Useful for calculating linearization polynomial coefficients for thermocouples and other non-linear sensors.

Risc.bat A batch file demonstrating the command line parameters of RISCTerm.exe.

RISCTerm.exe A dumb-terminal type communication program designed for RS422/485 operation. Used primarily with REMOTE ACCES Data Acquisition Pods and our RS422/485 serial communication product line. Can be used to say hello to an installed modem. RISCTerm stands for Really Incredibly Simple Communications TERMINal.

INSTALLING THE CARD

Before installing the card carefully read the ADDRESS SELECTION and OPTION SELECTION Sections of this manual and configure the card according to your requirements. Use the special software program called SETUP provided with the card. It supplies visual aids to configure all areas of the board.

Be especially careful with address selection. If the addresses of two installed functions overlap, you will experience unpredictable computer behavior.

To install the card:

1. Remove power from the computer.
2. Remove the computer cover.
3. Remove blank I/O backplate.
4. Install jumpers for selected options. See OPTION SELECTION, section 3.
5. Select the base address on the card. See ADDRESS SELECTION, section 4.
6. Loosen the nuts on the strain relief bar and swing the top end free.
7. Install the card in an I/O expansion slot. If convenient, select a slot adjacent to a vacant slot because this will make cable installation easier.
8. Thread the I/O cables, one by one through the cutout in the mounting bracket and plug them into the headers.
9. Smooth the cables as close as practicable to the card and, while holding them close to the card surface, swing the strain relief bar into position and tighten nuts.
10. Inspect for proper fit of the card and cables and tighten screws. Make sure that the card mounting bracket is properly screwed into place and that there is a positive chassis ground.
11. Replace the computer cover.

Input/Output connections are via four 50-pin headers on the card. A blank mounting bracket is provided with units that are marked for CE (European) Certification and, for these units, CE-certifiable cable and break-out methodology (cables connected to ground at the aperture, shielded twisted pair wiring, etc.) must be used. Also, it is important that the card mounting bracket be properly screwed into place and that there be a positive chassis ground.
FUNCTIONAL DESCRIPTION

FEATURES

- 96 Channels of Digital Input/Output.
- Four and Eight Bit Groups Independently Selectable for I/O.
- Interrupt and Interrupt-Disable Capability.
- +5V Supply Available to User.
- Compatible with Industry Standard I/O Racks like Opto-22, Potter & Brumfield etc.

APPLICATIONS

- Automatic Test Systems.
- Robotics
- Relay Monitoring and Control.
- Parallel Data Transfer to PC.
- Sensing switch closures or TTL, DTL, CMOS Logic.
- Driving Indicator Lights or Recorders.

DESCRIPTION

The IOD-96E board was designed for industrial applications and should be installed in a long slot of an IBM PC/XT/AT or compatible computer. The board contains four Programmable Peripheral Interface chips type 8255-5 (PPI) to provide computer interface to 96 digital I/O lines. Each PPI provides three 8-bit ports A, B, and C. Each 8-bit port can be configured to function as either inputs or output latches. Port C can also be configured as four inputs and four output latches.

Two I/O lines of each port can be used for interfacing User Interrupts to the computer. Interrupts are enabled by jumper installation or by a combination of jumper installation and a digital input line. You can use Interrupts #2 through #7. Interrupts of all ports (one per port) are OR'ed together.

I/O wiring connections are via 50-pin headers on the board. Five flat I/O cables connect IOD-96E to termination panels such as ACCES model STA-50. Also, this provides compatibility with OPTO-22, Gordos, Potter & Brumfield, etc. module mounting racks. Every second conductor of the flat cables is grounded to minimize the effect of crosstalk between signals. If needed for external circuits +5VDC power is available on each I/O connector pin 49. If you use this power, we recommend that you include a 1A fast blow fuse in your circuits in order to avoid possible damage to the host computer.
The board occupies sixteen consecutive bytes within the I/O address space. The base address is selectable via ADDRESS SETUP DIP switches (A5-A9) anywhere within the hex 000-3FF range. Refer to the OPTION SELECTION Section of this manual for a detailed description.

Utility software provided with the IOD-96E card is an illustrated setup program. Interactive displays show locations and proper settings of DIP switches and jumpers to set up board address, interrupt levels, and interrupt enable.

**Fig.1 IOD-96E BLOCK DIAGRAM.**

(Typical of Four Sections)
OPTION SELECTION

Refer to the illustrated setup programs on the CD provided with the card when reading this section of the manual. Also, refer to the OPTION SELECTION MAP below. Base address selection is covered both by the CD and in section 4 of this manual.

Interrupts are accepted on the I/O connector, pin 9 (port C3). The interrupt signal is positive true. Interrupts are enabled if I/O connector pin 1 (port C) is held low. Interrupts are disabled if I/O connector pin 1 (port C7) is held high. User interrupts are directed to interrupts #2 through #7 by jumpers marked IN2, 3, 4, 5, 6, 7.

The foregoing are the only manual setups necessary to use the IOD-96E. Input/Output selection is done, via software, by writing to the PPI 8255-5 Control Registers as described in the PROGRAMMING section of this manual.

Fig.2 OPTION SELECTION MAP
ADDRESS SELECTION

The IOD-96E Input/Output Card occupies 16 bytes of I/O space. The card base address can be selected anywhere within an I/O address range 000-3FF hex. However two installed options cannot share the same address. If in doubt where to assign the base address of the IOD-96E, refer to the Table below for a list of standard address assignments.

** These options can not be used together - addresses overlap

To set desired board address, refer to the illustrated Board Address setup program on the CD provided with the card. Type the desired address in hexadecimal code and the graphic display shows you how to set the ADDRESS SETUP switches. These switches are marked A4-A9 and form a binary representation of the address in negative-true logic. Assign ‘0’ to all ADDRESS SETUP switches turned ON, and assign ‘1’ to all ADDRESS SETUP switches turned OFF.
The following example illustrates switch selection corresponding to hex 2D0 (or binary 101101 xxxx) The "xxxx" represents address lines A3, A2, A1, and A0 used on the card to select individual registers at the PPI's. See section 5, PROGRAMMING.

**CAUTION**

Review the address selection reference table carefully before selecting the card address. If the addresses of two installed functions overlap you will experience unpredictable computer behavior.
SOFTWARE

ACCES supplies several programs to support the IOD-96E Digital I/O card and, also, to help you develop your applications software. These programs are on a CD that comes with your card and consist of a Setup program and three sample programs. (Other software included on the CD is described in the Installation section of this manual.) The sample programs are in forms suitable for use with QuickBASIC, C, and Pascal. The programs as follows:

* FINDBASE . . Locates available I/O addresses
* SETUP . . . Board Setup Program

FINDBASE

This DOS program provides means for you to select an I/O bus address that will not conflict with other installed computer resources. When you select a base address, the monitor displays a picture of the address-selection DIP switch that shows the correct positions of the switches to select the base address you want.

SETUP

This menu-driven program provides a picture of the card on the computer monitor. You make simple keystrokes to select the function you want and the picture changes to show how the jumpers or switches should be placed to effect your choices.

These programs do not program the card. You must manually place the jumpers and switches.
PROGRAMMING

The IOD-96E is an I/O mapped device that is easily configured from any language and any language can easily perform digital I/O through the card’s ports. This is especially true if the form of the data is byte or word wide. All references to the I/O ports would be in absolute port addressing. However, a table could be used to convert the byte or word data ports to a logical reference.

DEVELOPING YOUR OWN APPLICATION SOFTWARE

If you wish to gain a better understanding of the programs listed in the previous section, then the information in the following paragraphs will be of interest to you. Follow the 8255-5 Specification in APPENDIX A to program the PPI’s on the IOD-96E Digital Input/Output Card.

A total of 16 address locations are used by the IOD-96E for addressing the PPI’s; four for each PPI. The PPI’s are addressed using address bits A3 through A0 (See Address Selection, section 4 of this manual.) as follows:

CONTROL REGISTER ADDRESS SELECTION TABLE

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

The IOD-96E uses four 8255-5 PPI's to provide a total of 96 bits input/output capability. The card is designed to use each of these PPI's in mode 0 wherein:

a. There are two 8-bit ports (A and B) and two 4-bit ports (C Hi and C Lo).
b. Any port can be configured as an input or an output.
c. Outputs are latched.
d. Inputs are not latched.

Each PPI contains a control register. This Write-only, 8-bit register is used to set the mode and direction of the ports. At Power-Up or Reset, all I/O lines are set as inputs. Each PPI should be configured during initialization by writing to the control registers even if the ports are going to be used as inputs. Output buffers are automatically set by hardware logic according to the control register. Control registers are located at base addresses +03, +07, +0B, and +0F. Bit assignments in each of these control registers are as follows:

CONTROL REGISTER BIT ASSIGNMENTS

<table>
<thead>
<tr>
<th>Bit</th>
<th>Assignment</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>D0</td>
<td>Port C Lo (C0-C3)</td>
<td>1 = Input, 0 = Output</td>
</tr>
<tr>
<td>D1</td>
<td>Port B</td>
<td>1 = Input, 0 = Output</td>
</tr>
<tr>
<td>D2</td>
<td>Mode Selection</td>
<td>1 = Mode 1, 0 = Mode 0</td>
</tr>
<tr>
<td>D3</td>
<td>Port C Hi (C4-C7)</td>
<td>1 = Input, 0 = Output</td>
</tr>
<tr>
<td>D4</td>
<td>Port A</td>
<td>1 = Input, 0 = Output</td>
</tr>
<tr>
<td>D5, D6</td>
<td>Mode Selection</td>
<td>01 = Mode 1, 00 = Mode 0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1X = Mode 2</td>
</tr>
<tr>
<td>D7</td>
<td>Mode Set Flag</td>
<td>1 = Active</td>
</tr>
</tbody>
</table>

NOTE: Contact ACCES for directions if you wish to operate this card in mode 1 or mode 2.
PROGRAMMING EXAMPLE

The following programming example is provided as a guide to assist you in developing your working software. In this example, the card base address is 2D0 hex and I/O lines of Port 0 are to be setup as follows:

- **port A** = Input
- **port B** = Output
- **port C hi** = Input
- **port C lo** = Output

Configure bits of the Control Register as:

<table>
<thead>
<tr>
<th>D7</th>
<th>D6</th>
<th>D5</th>
<th>D4</th>
<th>D3</th>
<th>D2</th>
<th>D1</th>
<th>D0</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

This corresponds to 98 hex. If the card base address is 2D0 hex, use the `C` command to write to the control register as follows:

```c
Base=0x2D0;
outportb(Base+3,0x98);
```

To read the inputs at Port A and the upper nybble of Port C, use the `C` command:

```c
x=inportb(Base); //Read Port A
y=inportb(Base+2)/16; //Read Port C Hi
```

To set outputs high ("1") at Port B and the lower nybble of Port C:

```c
outportb(Base+1,0xFF); //Turn on all Port B bits
outportb(Base+2,0xF); //Turn on all bits of Port C Lo
```
SAMPLE PROGRAMS

The following sample programs are in TURBO-C and TURBO-PASCAL languages. They cover a security system that allows you to monitor the status of 16 switches and to automatically trigger four alarms that can be used to turn on lights, activate a siren, or send a signal to a silent alarm. The alarm system in this demonstration has four arming stations which toggle the alarm on or off. These programs are also provided on the CD that ACCES supplied with your IOD card.

TURBO-PASCAL PROGRAM

```pascal
TYPE sensor_array = array[0..15] of integer;

VAR sensors_at_arm : sensor_array;
{bit-by-bit status of sensors when alarm is activated. Used to notify user of open windows, etc}

VAR sensors_now : sensor_now;
{bit-by-bit status of sensors at current time. When compared against sensors_at_arm, indicates break-in if there is a change.}

VAR arming_stations : integer;
{variables representing all four arming stations. If value changes toggle alarm on/off}

VAR old_arming_stations: integer;

VAR hour, min., sec., hun. : word;
{variables used to retrieve time}

VAR key : char;
{useful temporary variable}

VAR i : integer;
{useful temporary variable, used in loops}

VAR j : integer;
{   "     "     "     "     "     "   }

procedure initialize_board;
{this procedure sets MODE 0 as active and sets Port A, B, and C LO as input and Port C HI as output}
begin
port[BASEADDR+3] :=$93;  {port[X] is Pascal's method of accessing the port memory. This code sets the port memory at address 303 hex, the control register, and to 93 hex because the bit pattern to set the desired mode and port designations is 10010011 which equals 93 hex}
end; {procedure initialize_board}
```
procedure read_sensors(VAR ary:sensor_ary);

VAR tempA : byte;          \{this procedure fetches data from Ports A and B\}
VAR tempB: byte;         \{and returns a binary representation of each sensor\}

begin
  tempA := port[BASEADDR]; \{this procedure loads tempA and tempB with corre
  tempB:=port[BASEADDR+1]; \{spending inputs

from the IOD card\}

CONNECTOR PIN ASSIGNMENTS

Four 50-pin headers are provided on the IOD-96E card; one for each group of 24 I/O lines. The mating connector is an AMP type 1-746285-0 or equivalent. Connector pin assignments are listed below. Notice that every second line is grounded to minimize crosstalk between signals.

Notes:
* This line is an I/O port and also an Interrupt Enable.
** This line is an I/O port and also a User Interrupt.
SPECIFICATION

Features

96 Input/Output lines
Pull-ups on I/O lines for CMOS and contact-closure compatibility.
Compatibility with module mounting racks

Digital Inputs

Logic High: 2.0 to 5.0 VDC.
Logic Low: -0.5 to +0.8 VDC.
Input Load (Hi): +10 uA.
Input Load (Lo): -10 uA.

Digital Outputs

Logic High: 2.5 VDC min., source 200 uA
Logic Low: 0.5 VDC max., sink 1.7 mA

Power Output: +5 VDC from computer bus (ext. 1A fast blow fuse recommended).

Power Requirements: +5 VDC at 400 mA typical.

Size: 7" long (178 mm).

Environmental

Operating Temperature Range: 0 degr. to 60 degr.C.
Storage Temperature Range: -50 degr. to +120 degr.C.
Humidity: 0 to 90% RH, non-condensing.
WARRANTY

Prior to shipment, ACCES equipment is thoroughly inspected and tested to applicable specifications. However, should equipment failure occur, ACCES assures its customers that prompt service and support will be available. All equipment originally manufactured by ACCES which is found to be defective will be repaired or replaced subject to the following considerations.

TERMS AND CONDITIONS

If a unit is suspected of failure, contact ACCES' Customer Service department. Be prepared to give the unit model number, serial number, and a description of the failure symptom(s). We may suggest some simple tests to confirm the failure. We will assign a Return Material Authorization (RMA) number which must appear on the outer label of the return package. All units/components should be properly packed for handling and returned with freight prepaid to the ACCES designated Service Center, and will be returned to the customer's/user's site freight prepaid and invoiced.

COVERAGE

First Three Years: Returned unit/part will be repaired and/or replaced at ACCES option with no charge for labor or parts not excluded by warranty. Warranty commences with equipment shipment.

Following Years: Throughout your equipment's lifetime, ACCES stands ready to provide on-site or in-plant service at reasonable rates similar to those of other manufacturers in the industry.

EQUIPMENT NOT MANUFACTURED BY ACCES

Equipment provided but not manufactured by ACCES is warranted and will be repaired according to the terms and conditions of the respective equipment manufacturer's warranty.

GENERAL

Under this Warranty, liability of ACCES is limited to replacing, repairing or issuing credit (at ACCES discretion) for any products which are proved to be defective during the warranty period. In no case is ACCES liable for consequential or special damage arriving from use or misuse of our product. The customer is responsible for all charges caused by modifications or additions to ACCES equipment not approved in writing by ACCES or, if in ACCES opinion the equipment has been subjected to abnormal use. "Abnormal use" for purposes of this warranty is defined as any use to which the equipment is exposed other than that use specified or intended as evidenced by purchase or sales representation. Other than the above, no other warranty, expressed or implied, shall apply to any and all such equipment furnished or sold by ACCES.
APPENDIX A
PPI DATA SHEETS

The data sheets in this Appendix are provided to help your understanding of the 8255-5 PPI which is manufactured by several companies. These data sheets are reprinted with permission of Mitsubishi Electric Corporation. (Copyright 1987).
